

Abstract of the Disclosure

A portable, freestanding room divider system comprises first and second sidewall partitions extending from one or more rear wall partitions to define exhibition booths. Each rear wall and side wall partition has a plurality of wall panels hinged together in a series. The rear wall partition includes first and last wall panels with end panels that have keyholes on opposite sides and an end support with wheels. An end wall panel of each sidewall partition has studs that engage the keyholes to secure the sidewall partition to the rear wall partition. At least some of the wall panels of the rear and sidewall partitions have feet projecting outward therefrom with wheels. A foot on each sidewall has a stand which raises and lowers the wheels with respect to the floor to control movement of the sidewall.
